

## Classwork --- Homework?

$$\textcircled{1} \quad 9x + 11 = 7x + 1$$

$$\textcircled{2} \quad \frac{5}{6}x - 2x + \frac{4}{3} = \frac{5}{3}$$

$$\textcircled{3} \quad 3x + 5 - 5(x + 1) = 6x + 7$$

$$\textcircled{4} \quad .2x - .5 = .1x + 7$$

$$\textcircled{5} \quad 4[2x - (3 - x) + 5] = 7x - 2$$

$$\textcircled{6} \quad .04(x - 12) + .06x = 1.52$$

$$\textcircled{7} \quad \text{SOLVE FOR } w.$$

$$P = 2l + 2w$$
